Circuit-breaker – **Series NRX, IZMX16, IZMX40**

Small, flexible, efficient.

Circuit-breaker – Series NRX IZMX16, IZMX40

EATON
Powering Business Worldwide

IZMX circuit-breakers, INX switch-disconnectors, from the NRX series up to 4000 A

Eaton's NRX series is a new line of circuit-breakers up to 4000 A. Engineering and mounting requirements are reduced thanks to only two compact sizes, the modular design and standard accessories. The highlight of the NRX series: The Digitrip 1150 P trip electronics. It covers all possible applications. And in conjunction with a communication module ensures that operation can be monitored from all round the globe. The innovative IZMX16 enables two circuit-breakers with a width of only 600 mm to be mounted in a switch cabinet.

NRX Series
Rated operational current from 630 to 4000 A, switching capacity 440 V AC, $I_{cu} = I_{cs}$ from 42 to 105 kA, 3 or 4 pole, fixed mounted or withdrawable, electronic releases for system protection, selective, universal protection, professional protection.

Extensive mounting accessories for fixed mounting and withdrawable units
Motor operator IZMX…M… +++ Shunt release IZMX…ST… +++ Closing release IZMX…-SR… +++ Undervoltage release IZMX…-UV… +++ Auxiliary contact ON-OFF IZMX…-AS… +++ Latch check switch IZMX…LCS… +++ Overload trip switch IZMX…-OTS +++ Mechanical interlocks.

Extensive range of control units and communication
The Digitrip™ control unit offers the most extensive range of functions in its class. It covers all requirements: from simple system protection to professional protection with additional parameter, protection, measuring, analysis, diagnostics and event memory functions that can be shown on an LCD color display or transferred remotely via a communication module, displayed on a web page or sent worldwide by email. Unique in this range: the LCD color display. Digitrip can be integrated in different data networks together with Eaton's plug & play communication modules: MODBUS, PROFIBUS or Ethernet. Circuit-breakers can then be monitored directly via the Internet.

Worldwide novelty ARMS™ – greater safety for maintenance personnel
In the event of an arc fault the patented ARMS™ (Arcflash Reduction Maintenance System) trips faster than a short-circuit release. In conjunction with the NRX (IZMX) series, additional components of the ARCON™ arc fault protection system offer additional arc fault protection.

Powering Business Worldwide

Discover Eaton – a leader in the power management field

Since 1911, when our company began trading as a small truck parts supplier, Eaton® Corporation has come a long way. Today, as a diversified power management company, Eaton has sales of $13.7 billion USD (FY 2010), employs 70,000 people and has customers in more than 150 countries. Everyday, we help companies across the world to manage power, and do more, while consuming less energy.

Eaton's innovative products, solutions and technologies are designed to help customers to manage power and conserve resources while working more productively, safely and sustainably. Our integrated and diversified business strategy ensures that we remain at the forefront of our industry, decade after decade.

Aerospace

A leading global supplier to commercial and military aviation and aerospace industries. An extensive technology portfolio includes hydraulic systems, fuel systems, motion control systems, propulsion sub-systems, cockpit controls and displays and fluid health monitoring systems. Our products improve fuel economy, aircraft performance, reliability and safety.

Truck

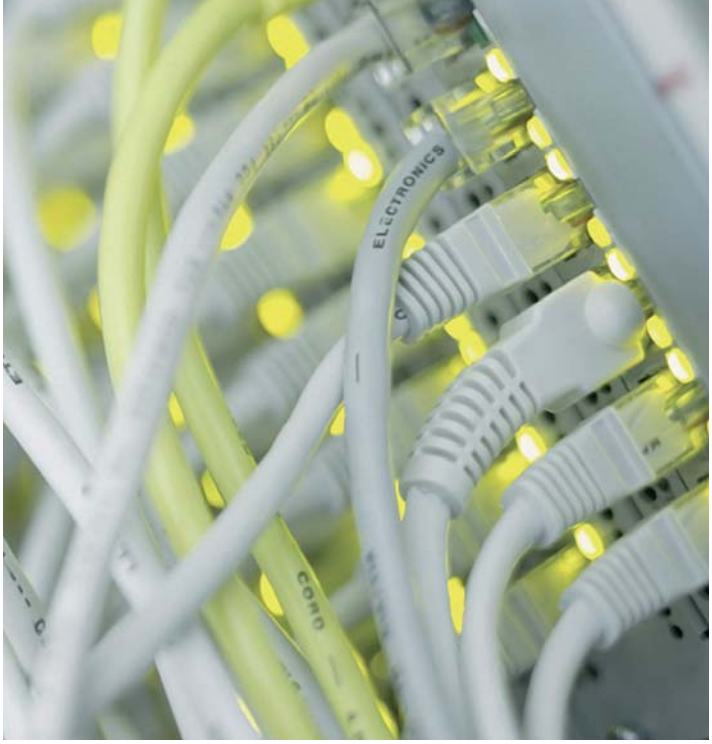
A leader in the design, manufacture and marketing of complete line of drivetrain systems and components for medium- and heavy-duty commercial vehicles. Under the "Roadranger" brand, Eaton also markets lubricants, safety products and service tools. Eaton's hybrid power systems have earned the company recognition as a global leader in alternative power for commercial vehicles.

Electrical

A global leader in electrical control, power distribution, uninterruptible power supply and industrial automation products and services. Our products provide customer-driven PowerChain Management® solutions to serve the power system needs of the industrial, institutional, government, utility, commercial, residential, IT, mission critical and OEM markets worldwide.

EATON

Powering Business Worldwide



Powering electrical systems worldwide

Buildings

- Residential
- Healthcare
- Education
- Commercial offices
- Retail
- Public sector
- Airports

- Electrical distribution solutions for safe and efficient power delivery
- Power quality systems for uptime and reliability
- Power metering and monitoring to add intelligence and save costs
- Industrial control products for HVAC applications

Information Technology

- Data centers
- Telecommunication
- Networks
- Computer rooms

- World's most efficient line of UPSs to reduce footprint and save energy
- Reliable power systems with inherent redundancy to improve availability
- Power metering and monitoring to diagnose problems and lower costs
- Local service and support for quick response

Eaton Catalogs in the App Store – all catalogues close at hand!

In order to meet the needs of increasingly mobile customers and employees, Eaton is offering a mobile solution for communication and product information from June 2011.

Clearly designed shelf view

The Eaton Catalogs app offers an outstandingly clear user interface and several fully developed functions. In the form of a shelf view, the user is provided with a clear overview of Eaton's latest product catalogues. These can be leafed through on the fly or downloaded to the device – for situations when there is no Internet access. Choose for yourself which catalogues are of interest and keep up-to-date using the Update function.

Intuitive browsing, searching and finding

Users can simply browse through the catalogues with intuitive navigation ensured. A linked table of contents, thumbnail views and a rapid search function are also provided for finding information quickly and conveniently.

Linked data sheets

It is often the case that product information is required which is not available in the product catalogues. The "Eaton Catalogs" contain article numbers and type designations that are linked to the Online Catalogue. This enables the user to access highly detailed production information in the form of a technical data sheet. From here other documents such as installation instructions and technical publications can be called up.

Whether on the building site, at the customer, on the train or at home – "Eaton Catalogs" make sure that all product information is close to hand.

In the App Store from
June 2011

Scan the QR code with your iPhone or iPad and you will immediately access "Eaton Catalogs".

The Eaton online catalogue

THE PRODUCT GROUP TREE

- Information
- Control circuit devices
- (Safety) position switches/sensors
- Pressure switches
- Cam switches, switch-disconnectors up to 315 A
- Timing and measuring relays
- Safety relays, safety control relays
- Control relays, multi-function-display
- Touch panel, PLC, I/O expansion
- Contactors
- Overload relays
- Motor-protective circuit-breakers
- Motor-starter combinations
- Soft starters
- frequency inverters
- distributed drives engineering
- Compact circuit-breakers up to 1600 A
- Compact switch-disconnectors up to 1600 A
- Circuit breakers up to 6300 A
- Switch-disconnectors up to 6300 A
- Miniature circuit-breakers
- Transformers

The product group tree: Clear layout of the Eaton products in product groups.

The one-dimensional product structure ensures the user can easily locate the product with a few clicks.

THE SEARCH

Contactor
- adapter for contactor
- amplifier module for contactor

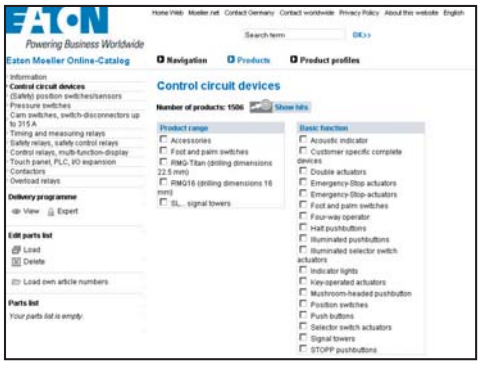
Search/result list: high performance search with suggestion list by “Entry”.

A suggestion list brings the search an above-average success rate, because nothing makes less sense than a 0-hit result.

SELECTION AIDS



The selection tools: 3 clicks to product

Selection-relevant features allow users to locate their products easily, without problems. From general to specific to product – 3 clicks!

The catalogue portal is the entry page to the Online Catalogue. Important elements include the powerful search function and the graphical navigation. The clearly designed user interface makes the application particularly easy to use.

Continuous updating ensures that you will always find the latest product data and news.

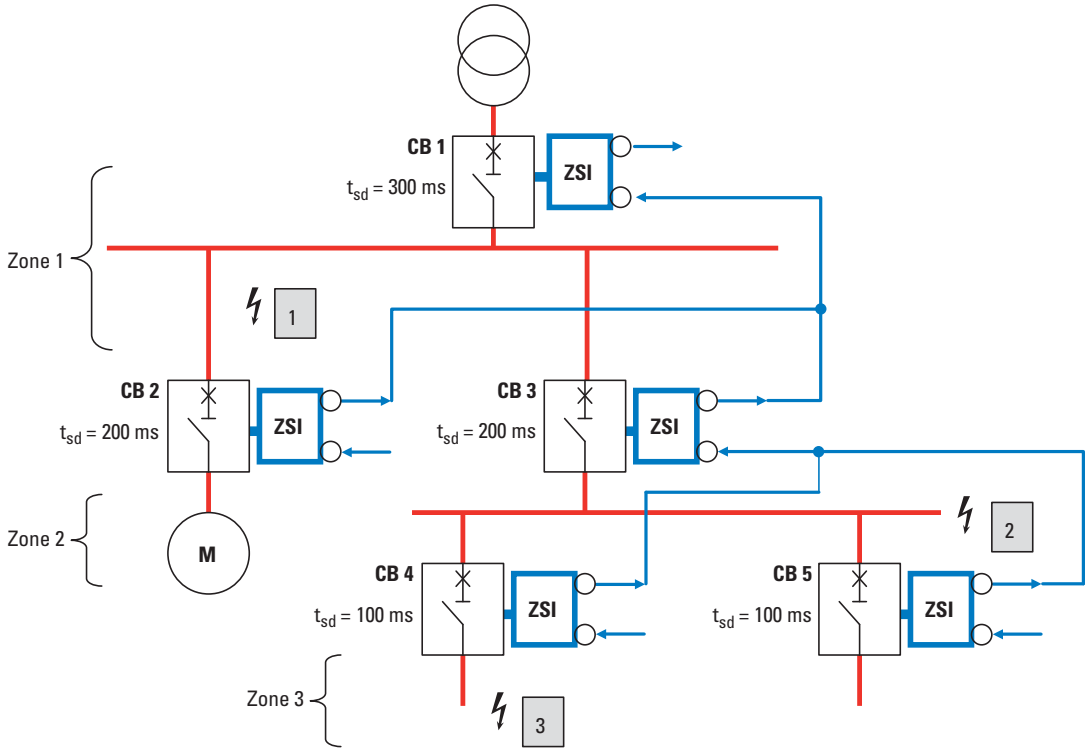
Zone Selective Interlocking



CB = **C**ircuit **B**reaker
ZSI = **Z**one **S**elective **I**nterlocking

Zone Selective Interlocking

- Zone Selective Interlocking (ZSI) is described in the soon to be published standard IEC 61912-2 Low voltage switchgear and controlgear.
- The term zone selective interlocking is used to describe a method of controlling circuit breakers to provide selectivity with very short interruption times for the breaker closest to the fault.
- There are different levels (zones) of protection that isolate the fault in the distribution system.
- ZSI may be applied for faults between phases or earth-faults or both.
- ZSI is applied to the short time faults where time selectivity can be achieved with the breakers between the zones.
- Because ZSI does not require auxiliary power or additional modules to operate set up time is minimal and application is easy.

Zone Selective Interlocking Example

Example A – Short-circuit at position 3

- Circuit-breakers CB1, CB3, CB4 all see the short circuit current and register a short delay pick-up.
- Circuit breaker CB4 sends a ZSI output blocking signal to CB3 ZSI input. CB3 sends a ZSI output blocking signal to CB1 ZSI input. CB1 sends a ZSI output signal that is not wired. This signal could be wired to a MV relay on the other side of the transformer with a compatible ZSI circuitry.
- CB1 registers the ZSI input signal and starts its timer for 300ms. CB3 registers the ZSI input signal and starts its timer for 200ms. CB4 gets no input from any lower zone circuit breaker. This breaker will then trip immediately without any time delay. CB4 interrupts the fault and CB1 and CB3 stop short delay timing because the fault current is gone.
- If for some reason CB4 does not open and interrupt the fault then at the end of the its short delay time CB3 will open and interrupt the fault.

Example B – Short-circuit at position 2

- Circuit-breakers CB1, CB3, see the short circuit current and register a short delay pick-up. CB4 and CB5 do not see the fault current and do not send a ZSI output.
- Circuit breaker CB3 sends a ZSI output blocking signal to CB1 ZSI input. CB1 sends a ZSI output signal. In this example that signal is not wired.
- CB1 registers the ZSI input signal and starts a timer for 300ms. CB3 gets no input from any lower zone circuit breaker. This breaker will then trip immediately without any time delay. CB3 interrupts the fault and CB1 stops short delay timing because the fault current is gone. The clearance time is reduced by approximately 150ms.

Example C – Short-circuit at position 1

- Only Circuit breaker CB1sees the short circuit current and registers a short delay pick-up. CB2, CB3, CB4 and CB5 do not see the fault current and do not send ZSI outputs.
- CB1 sends a ZSI output signal. In this example that signal is not wired.
- CB1 gets no input from any lower zone circuit breaker. This breaker will then trip immediately without any time delay. CB1 interrupts the fault and the clearance time is reduced by approximately 250ms.

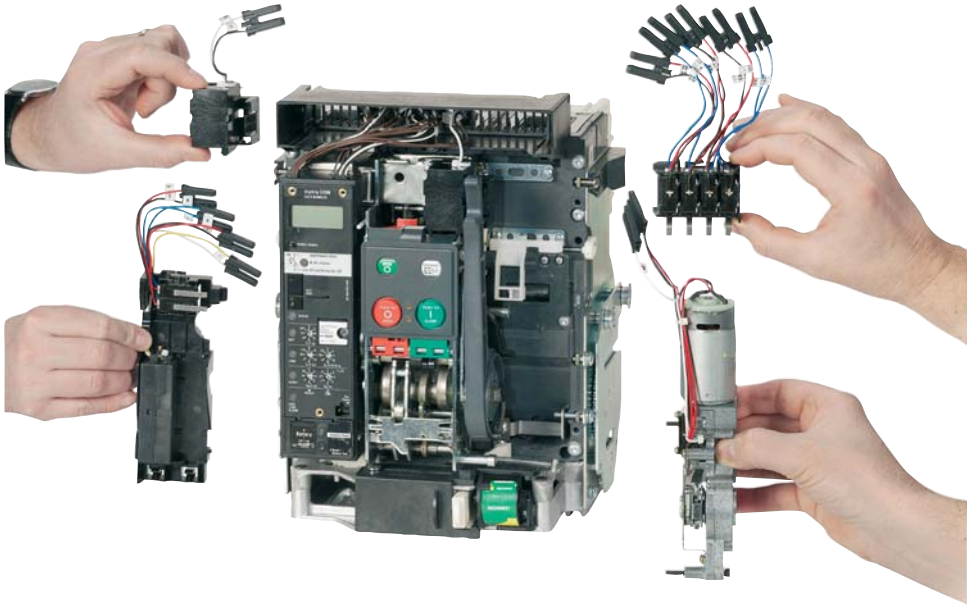
Space-saving circuit-breakers with useful accessories



Eaton Introduces Series NRX!

The new NRX series from Eaton is a new series of air circuit-breakers with an extensive range of accessories. The new range provides users with two compact frame sizes up to 4000A, modular design, common accessories, easy to integrate communications and a full range of trip units including the new powerful high end 1150 Digitrip trip unit with a full color LCD display. The innovative concept of the **IZMX16** makes it possible to install two withdrawable circuit-breakers in a 600 mm wide section. This enables more economical section design and also saves operating space. The compact modular design of the **IZMX40** offers customers a full range of high performance ratings in a single frame size simplifying the integration process into panel boards and switch boards. **Series NRX**, a new generation and new standard in circuit protection.

Applications

The circuit breakers can be used in four main application areas depending on the type of equipment to be protected:

- System protection
- Motor protection
- Transformer protection
- Generator protection

These key applications make different demands on the switches, which are met with a range of control units.

Switches with closing release
They are particularly suitable for synchronization tasks.
Coupler switches
In addition to the circuit-breakers, switch-disconnectors are also available. These are used, for example, as coupler switches between different power supplies. The switch-disconnectors are used as coupler switches for different sections of a network in conjunction with our automatic network switching device.

Modular Design, Common Accessories

The retrofitting of accessories is made considerably easy thanks to the efficient "plug & work" technology. Accessory drawers and snap-fit mechanisms make it possible to fit the latest accessories with virtually no tools. This flexibility allows you to respond easily to changing requirements within your system. Most accessories for Series NRX are common to both the compact and standard frame sizes.

Standard scope of delivery

- With the new **Series NRX** range, you select a basic device that is already fitted with an electronic release.
- The standard mounting for both frames is on a horizontal mounting plate or on horizontal traverses in the switching cabinet. The **IZMX16** can also be fastened to vertical mounting plates.
- With four-pole devices, the neutral conductor is arranged on the left (front view).
- The neutral conductor can be loaded 100% like the phase conductors.
- The circuit-breakers are provided with a standard mechanical reclosing lockout. After an overload trip, the fault is usually examined first. After the fault is identified and rectified, the mechanical reclosing lockout is reset by pressing the red mechanical trip indicator on the front of the circuit-breaker.
- A "remote-reset" feature and an "automatic reset" are offered as additional ordering options. The remote reset enables resetting the breaker after an over current trip via a control voltage. The automatic reset option enables the circuit breaker to be restored to normal operation immediately after an over current trip (i.e. there is no mechanical reclosing lockout). In these applications compulsory fault analysis is intentionally avoided.
- The number of secondary control cable terminals depends on the accessories fitted.
- If a cassette is ordered without the basic device, this can be already fitted with the maximum number of control cable terminals. For greater economy in large plants, the cassette is also offered without control circuit terminals so that fitting can be carried out later at the installation or when accessories are required at a later time..
- The withdrawable basic device includes the primary finger clusters and levering-in mechanism. NOTE: Some manufacturers mount the primary finger clusters inside the cassette cell, which requiring shutdown of the panel board for inspection and maintenance.
- 2 changeover contacts are provided as standard for ON/OFF status indication.
- A coding mechanism between the basic device and the cassette prevents impermissible combinations ("Rejection Interlock").
- The door escutcheon is always included in the scope of delivery. With withdrawable designs this is supplied with the cassette (withrawable unit).
- On withdrawable units the circuit breaker can be pulled out to inspect the arc chutes. With fixed units, it is recommended that sufficient space is provided above the circuit breaker to enable inspection. An additional cover is not required.
- All basic devices that are provided with universal protection (Digitrip 520M), feature a 4-digit LCD display, and all devices provided with power measurement protection feature a full color LCD display.
- On each circuit-breaker the integrated Digitrip electronic release is factory fitted with a sealable protective cover.
- If a motor operator is ordered, the "Spring-operated stored energy mechanism tensioned" indicator switch is automatically provided.

Additional benefits Series NRX

- The "universal" design of the main terminal offers maximum flexibility. The horizontal terminal can be rotated simply at the installation so that it can also be used as a vertical connection. With withdrawable units, additional terminal pieces can even be dispensed with. Both the **Series NRX** breaker and the cassette offer an integrated flange terminal to which the system busbars can be connected directly. For this reason, the main terminal pieces for **Series NRX** are not part of the standard scope of delivery. Don't forget to order additionally required terminal pieces if required.
- Thanks to the separate mounting position, a switching operations counter can now be used also independently of a motor operator.
- Withdrawable unit operation: The unit is actuated with a hand crank supplied as a standard feature and has a secure position in the basic device.

External 24 V supply

- The standard protection functions of **Series NRX** operate independently of an external control voltage supply. The power supply of the electronics unit, for example for overload and short-circuit protection, is implemented via the current transformers integrated in the circuit-breaker.
- The universal and power measurement release units with display can be fed with a 24 V DC supply so that the display function can be used without a load. An external 24 V DC power supply is needed if communication functions are required

CurveSelect characteristics program

Display characteristic curves according to specific settings and assess their interaction effectively:
www.moeller.net/de/support

Communication capability

The communication-capability of **Series NRX** circuit-breakers open up new possibilities in power distribution. The trip unit provides all important operation information and passes this on via one of the various communication adapter modules. This increases system transparency and shortens the response times to states such as overcurrent, phase asymmetry and overvoltage. A rapid intervention in a process can, for example, prevent downtimes and help to schedule maintenance activities and therefore boost plant availability. **Series NRX** offers interface modules to support protocols such as Modbus RTU, Profibus, and INCOM. In addition Eaton also offers a direct connect Ethernet Communications module that provides web enabled monitoring and control of the trip unit metering, logging, alarms, and control functions using a standard web browser.

Greater safety for maintenance personnel with ARMS™

Personnel safety is of paramount importance in today's work environment. Of recent concern is the potential for serious injury due to exposure to electrical arcs. Eaton's Series NRX trip units offer the patented ARMS system (Arcflash Reduction Maintenance System™), which offers a non-delayed immediate disconnection is in the event of an arc fault. This disconnection is even faster than that of a non-delayed short-circuit release. This function can be activated directly on the circuit-breaker or via an external switch, such as when maintenance personnel enter a hazardous area.

Major Benefits of ARMS:

- Increased personnel safety – by limiting the available arc flash energy
- Simple to operate
- Enabled with circuit breaker door closed by a door mounted lockable switch
- Enabled only for the time required to perform the desired maintenance work
- Preserves overcurrent coordination under normal conditions
- Reduction in incident energy levels may permit reduced levels of Personal Protective Equipment (PPE), therefore improving worker comfort and mobility

Other components of the ARCON arc fault protection system, in conjunction with **Series NRX**, enable an expansion of arc fault protection in stages.
ARCON on the Internet:
www.moeller.net/arcon

Selection criteria for circuit-breakers

Fundamental criteria for the selection of circuit-breakers:

- **Max short-circuit current I_k** max at the circuit-breaker' point of installation: this value determines the short-circuit breaking capacity or the short-circuit current carrying capacity of the circuit-breaker. It is compared with the I_{cu}, I_{cs} and I_{cw} values of the switch and essentially determines its size (see technical data).
- **Rated operational current I_n** which should flow through the respective branch circuit: This value must not be greater than the maximum switch rated operational current of the circuit-breaker. The rated operational current can be adjusted down using additional rated operational current modules.
- **Ambient temperature of the circuit breaker:** This is generally the internal temperature in the control panel. Observe the derating values with increased ambient temperature (see Technical data).
- **Circuit-breaker type:** fixed mounted or withdrawable units, 3 or 4 pole.
- **Minimum short-circuit current**, which flows through the switching device: The release must recognize this value as a short-circuit and may react with a trip.
- **Protection functions of the circuit breaker:** This is determined by the selection of the respective overcurrent release.

For additional resources and tools for selecting Eaton Air Circuit Breakers please visit us as www.eaton.com/seriesnrx.

Note For more information on Series NRX, please visit www.eaton.com/seriesnrx.

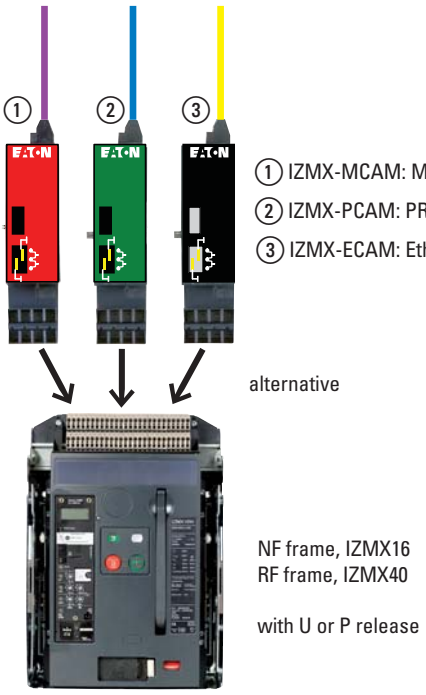
Communication Options for Series NRX

For the Series NRX range, PROFIBUS-DP or Modbus RTU communication protocols are supported by optional fieldbus connection accessories. Communication adapter modules are compact units for direct mounting in the auxiliary terminal strip. When retrofitting, four auxiliary terminals are replaced with one communication module. The terminals provide all data available in the trip unit to the fieldbus, including switching state, current, voltage, power, energy, and diagnostic information such as overcurrent, phase asymmetry and overvoltage as measured by trip unit. Through the communication module the trip unit maintenance mode can be enabled and the breaker can also be opened and closed via the Spring Release and Shunt Trip when wired accordingly. In addition to PROFIBUS-DP and Modbus RTU, Series NRX also offers an additional communication module for direct Ethernet connection to the circuit breaker. The Ethernet adapter module supports web enabled browsing direct from the module and supports Simple Network Mail Protocol (SNMP) for alarm or event notifications.

Requirements

The communication adapter modules can be used in combination in both NF and RF Frame breakers (IZMX16/40) and in combination with Digitrip trip units with Metering and Power Measurement capability:
- Digitrip 520M (… -U Types)
- Digitrip 1150i (…-P Types)

Configuration



PROFIBUS-DP configuration

Communications module IZMX-PCAM has a 9-pin D-Sub socket for connection to PROFIBUS. The module works as a slave on PROFIBUS-DP; the data is defined through a standardized device master data file, which permits smooth integration of IZMX in a DP line.
- On the PROFIBUS-DP side the module supports automatic baud rate detection; the PROFIBUS-DP bus address is set through the trip unit's display. The maximum cable length is 2.4 km.
- To operate the IZMX-PCAM, a supply voltage of 24 V DC is required.
- The data connection to the circuit-breaker is implemented internally through a serial highspeed data connection.

Data access via PROFIBUS-DP
The data on PROFIBUS-DP are offered according to the profile for low-voltage switchgear (LVSG) of PROFIBUS International (PROFIBUS and PROFINET User Group). Five different data structures with varying numbers of parameters are available through the device master data file. This allows a data filter to be easily implemented, which simplifies integration of the Series NRX data into the control system.

Modbus configuration

Communications module IZMX-MCAM has a plug-in screw terminal for connection to Modbus. The module operates as a Modbus slave.
- Baud rate, data format and address (max. 247) for Modbus are set with the input keys of the trip unit. The maximum cable length is 1.2 km.
- The Modbus must be terminated with a 120 Ω terminating resistor.
- To operate the IZMX-MCAM, a supply voltage of 24 V DC is required.
- The data connection to the circuit-breaker is implemented internally through a serial highspeed data connection.

Data access via Modbus
The data is contained in comprehensive data tables. Each data point is available as floating-point (IEEE) or fixed-point value. This variance allows the integration of the IZMX to be adapted to the Modbus architecture. This enables a simple means of implementing a data filter, which facilitates the integration of IZMX data in the control system.

Ethernet configuration

Communications module IZMX-ECAM has standard RJ45 socket for connection to Ethernet. This module has a configured web server on board and supports Simple Network Mail Protocol (SNMP) for alarm or event notifications.
- IP address and related parameters are set through the trip unit's display.
- The data connection to the circuit-breaker is implemented internally through a serial high speed data connection.
- To operate the IZMX-ECAM, a supply voltage of 24 V DC is required.

Data access via Ethernet
The data is contained in different web pages structured according to the topics „Data View", „Alarms", „Logs" and „Configuration". This variance allows the integration of the IZMX to be adapted to all Ethernet networks supporting http protocol. An „around the world access" to the breaker becomes reality and using the SNMP protocol alarm messages can be transported everywhere.

Notes

Trip unit options and accessories
Communication: The communication interface is integrated in the secondary place.
Combination of Earth-Fault Protection and ARMS: In the case both options are used in combination the Earth-Fault Protection is limited to 1200 A.
The TM ARMS arc fault reduction system for maintenance reduces the time required for rectifying faults in a simple and reliable way, thus increasing safety. The ARMS module is provided with an isolated tripping circuit that responds faster than the non-delayed trip used for standard protection. During maintenance work in areas downstream of the circuit-breaker, the energy (radiation, temperature and pressure) released in the event of an accident is considerably reduced by the ARMS function.
If LED or other signaling informations are required while the breaker is in OFF, an external power supply 24 V DC is necessary.

Rating plugs
IZMX-RP…

Rating plugs (Rate current modules), 3 pole, 4 pole. → page 71

The rated current can be reduced by changing the rating plug, for example, in order to adapt to changed conditions in the application.
The rating plug's nominal value must be less than or equal to the basic device's rated current.
The rating plug can be replaced on site without replacing the transformer.
200 A, 250 A and 300 A rating plugs cannot be combined with P-trip units.

for IZMX16

Rating plugs (Rate current modules), 3 pole, 4 pole. → page 71

The rated current can be reduced by changing the rating plug, for example, in order to adapt to changed conditions in the application.
The rating plug's nominal value must be less than or equal to the basic device's rated current.
The rating plug can be replaced on site without replacing the transformer.
200 A, 250 A and 300 A rating plugs cannot be combined with P-trip units.

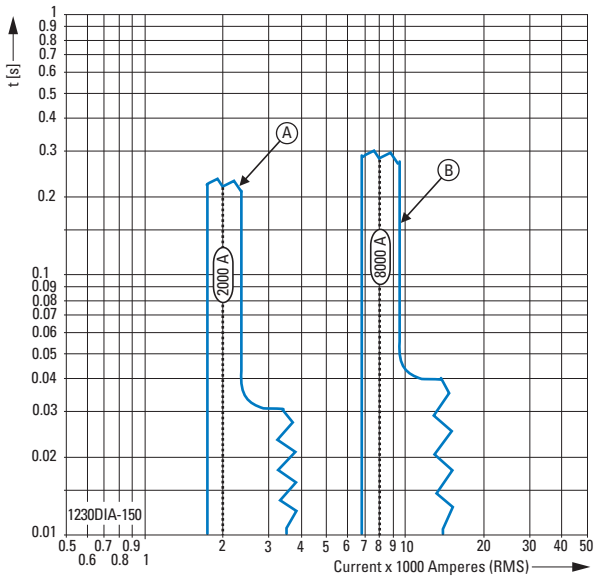
IZMX16(40)…U… Option Maintenance mode option +IZMX-DTU-M

ARMS-maintenance mode, characteristic curve

See Notes 2, 6, 11, 17, 18, 19, 20 → page 62.



A Maintenance mode trip IZMX16
B Maintenance mode trip IZMX40

Notes:

1 The trip unit has a thermal memory, which can shorten the value in the overload range. This function plays a role whenever a current is higher than the overload release's value and which is then isolated by a downstream circuit-breaker or the circuit-breaker itself. On a subsequent overload current the circuit-breaker will trip more quickly than normal. The reduced value is inversely proportional to the time expired since the last overload. After about five minutes the thermal memory is reset.

2 The end of the characteristic curve is determined by the type of -application and the switching capacity of the selected switch.

3 The overload release trips at 110 % I_r with a tolerance of ±10 % (indicated by the "Status" LED). The short-time delayed short-circuit release I_{sd} is activated at a pick-up time of conventionally 100 % with a tolerance of ±10 %.

4 When zone selectivity (ZSI) is activated in the short-time delayed short-circuit release and no blocking signal is applied, the minimum time value (0.10 s) applies irrespective of the short-time delay settings.

5 The upper lines of the I^2t characteristic curves are horizontal from a value of 8 × I_r (indicated by the points).

6 The listed overall switch-off times include the response times of the trip unit, the opening times of the switch and the time required to switch off the current.

7 The characteristic curves apply to applications in a temperature range from -20 °C to +55 °C. Temperatures over +85 °C cause automatic tripping, indicated by an orange-colored LED. The circuit-breaker must be selected according to the temperature-dependent derating values from the table in the technical data.

8 The non-delayed short-circuit release is activated at a response value of conventionally 100 % with a tolerance of ±10 %.

9 The non-delayed short-circuit release can be disabled by the user with an additional OFF position. This ensures that short-circuit currents are disconnected exclusively by the short-time delayed short-circuit release. Total selectivity-> Seite 72.

10 All trip units feature an additional, permanently set non-delayed short-circuit release, which becomes active at a peak value of 90 kA. Tripping by this short-circuit release is indicated by a flashing INST LED. This -protective function remains active when non-delayed tripping is set to Off.

11 The listed overall switch-off times are conservative and take into account the trip unit's maximum response times, the circuit-breaker's maximum opening delays and the longest current interruption times with regard to factors that contribute to worst-case conditions, such as maximum rated operational voltage, single-phase interruptions and minimum power -factor. Fast breaking times are possible but depend on the system -conditions and the circuit-breaker model.

12 The ground-fault release is activated at a response value of -conventionally 100 % with a tolerance of ±10 %.

13 Unless otherwise specified, the current value tolerances are ±10 % of the values shown in the diagram.

14 In combination with ARMS function, ground-fault protection is limited to 1200 A.

15 When zone selectivity (ZSI) is activated in ground-fault protection and no blocking signal is applied, the minimum time value (flat characteristic curve) applies irrespective of the settings.

16 The upper lines of the I^2t characteristic curves are horizontal from a value of 0.625 × I_r (indicated by the points).

17 The maintenance mode function (ARMS) must be activated with a switch or through the communications terminals for these characteristic curves to apply. A blue LED indicates that the maintenance mode settings are active.

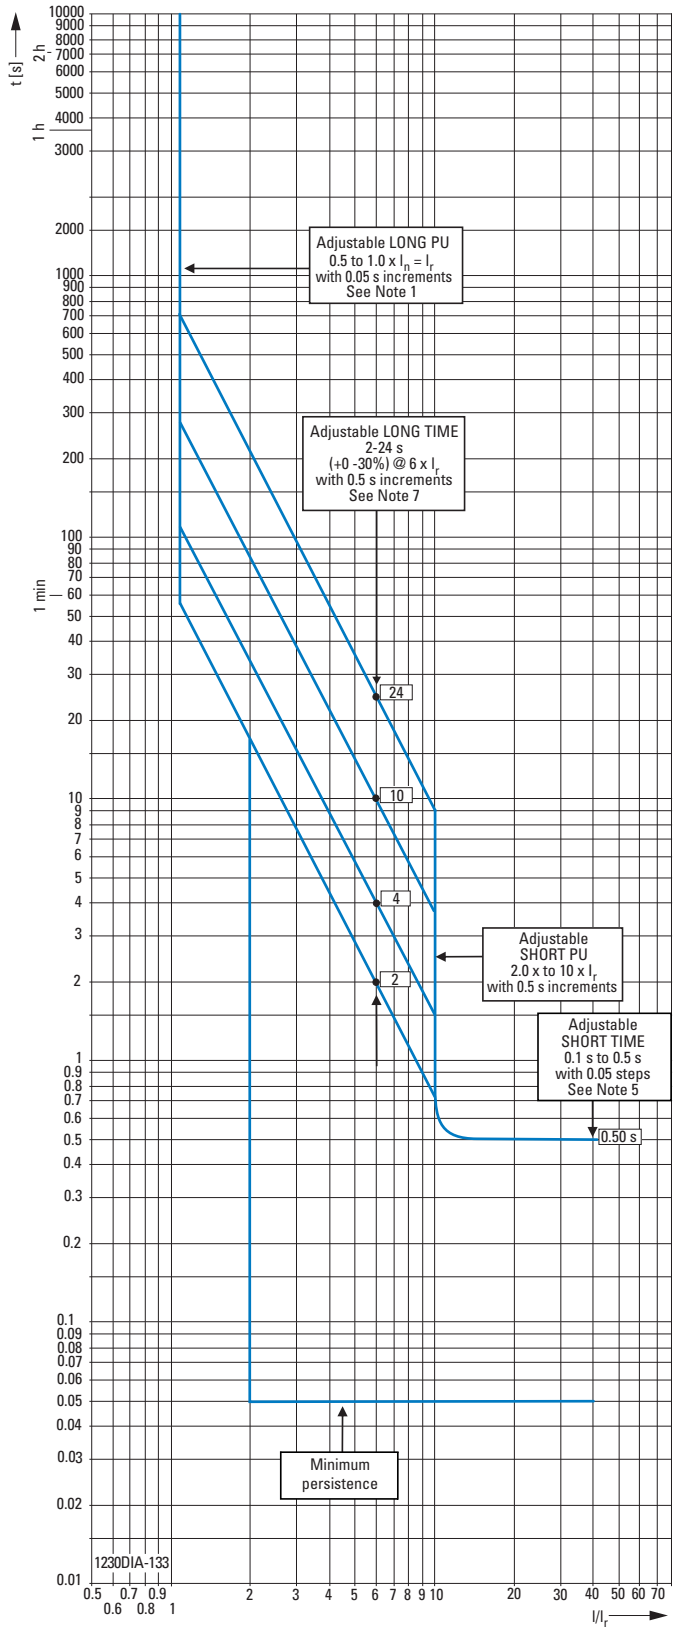
18 The shown switch-off times apply for connection to an additional auxiliary power supply.

19 Tripping by the ARMS Maintenance Mode Trip is indicated by the non-delayed short-circuit protection LED.

20 The tolerance is ±15 %.

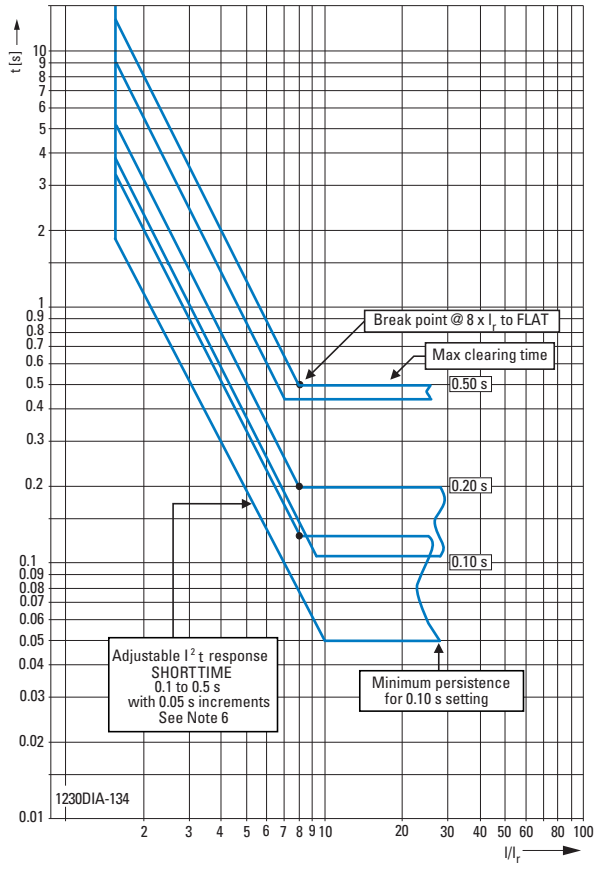
IZMX16(40)…P… Tripping characteristics for professional protection

Digitrip 1150/1150i - L, S and S with I^2t Curves



Apply to Series NRX Type IZMX16 (NF) and IZMX40 (RF) circuit-breakers.
Long Delay (I^2t) & Short Delay Trip (FLAT & I^2t)
This curve is for 50 Hz or 60 Hz applications.

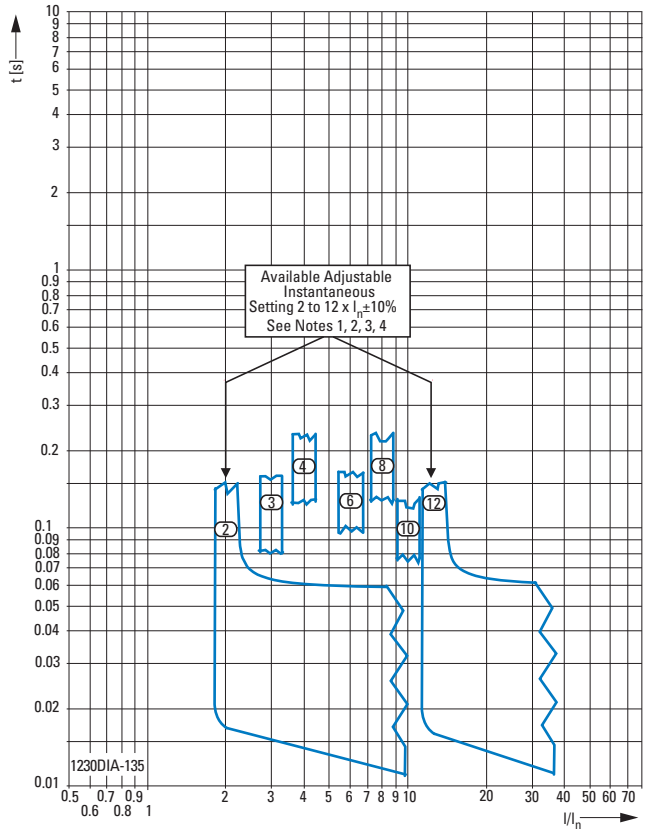
Notes:
1. This curve shown as a multiple of the LONG PU Setting (I_r). The actual pickup point (indicated by rapid flashing of Unit Status LED on the product) occurs at 110 % of the Ir, current, with a ±10 % tolerance.
The SHORT TIME function and the LONGTIME function act independently and the entire set of LONGTIME curves continue to be active even after the curves intersect.
2. If Long Delay Memory is enabled, trip times may be shorter than indicated on this chart.
3. With zone interlocking on Short Delay utilized and no restraining signal, the minimum SHORT TIME band (0.10 s) applies regardless of the SHORT TIME setting.
4. The SHORT PU points have 100 % ± 10 % tolerance.
5. SHORT SLOPE: FLAT
Tolerance is +0 / -90 ms for all settings except
0.10 s setting is 0.05 to 0.13
0.15 s setting is 0.09 to 0.17
6. SHORT SLOPE: I^2t
I^2t slope flattens out at 8 x I_r for top of band with FLAT time minimum value prevailing for bottom of band.
The tolerance is
+0 / -40 % for settings 0.1 to 0.25
+0 / -30 % for settings 0.3 to 0.50
7. The end of the curve is determined by the interrupting rating of the circuit breaker.
8. Curve applies from -20 °C to +55 °C ambient. Temperatures above +85 °C of the Trip Unit cause automatic trip.



Notes The total Instantaneous clearing times shown are conservative and consider the maximum response times of the trip unit, the circuit breaker opening, and the interruption of the current under factors that contribute to worst case conditions, like: maximum rated voltages, single phase interruption, and minimum power factor. Faster clearing times are possible depending on the specific system conditions, the type of circuit breaker applied, and if any arc reduction settings are employed.

IZMX16…P… Tripping characteristics for professional protection

Digitrip 1150/1150i - I-Instantaneous Curves



Apply to Series NRX Type IZMX16 (NF) and IZMX40 (RF) circuit-breakers.
Instantaneous Trip
This curve is for 50 Hz and 60 Hz applications.

Notes:
1. The end of the curve is determined by the interrupting rating of the circuit breaker.

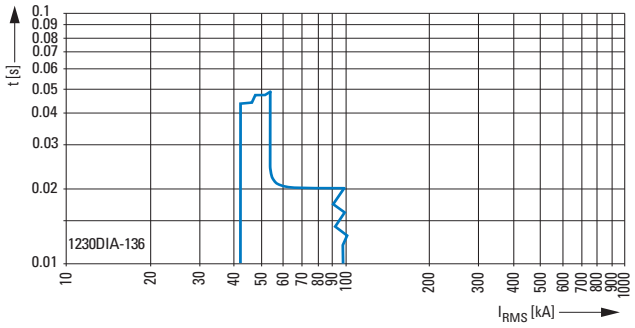
2. This curve is shown as a multiple of the Rating Plug (I_n).

3. The Instantaneous settings have conventional 100 % ±10 % as the pickup points.

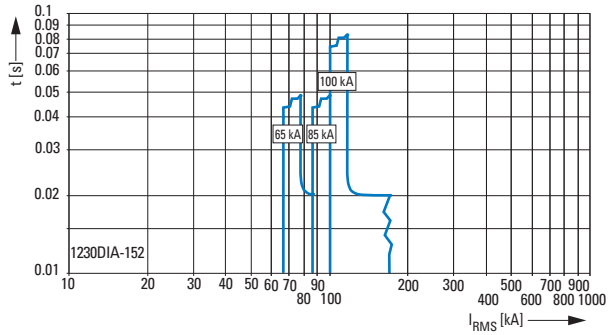
4. Total clearing times shown include the response times of the trip unit, the breaker opening and the interruption of the current.

5. An additional, fixed High Instantaneous Trip function is provided in the circuit breaker set to pickup at 90 kA Instantaneous peak current level. This protection is functional even when the Instantaneous is set to the OFF position.

I-protection: For high short-circuit-protection for IZMX16 only
See Notes 5 → Page 62.



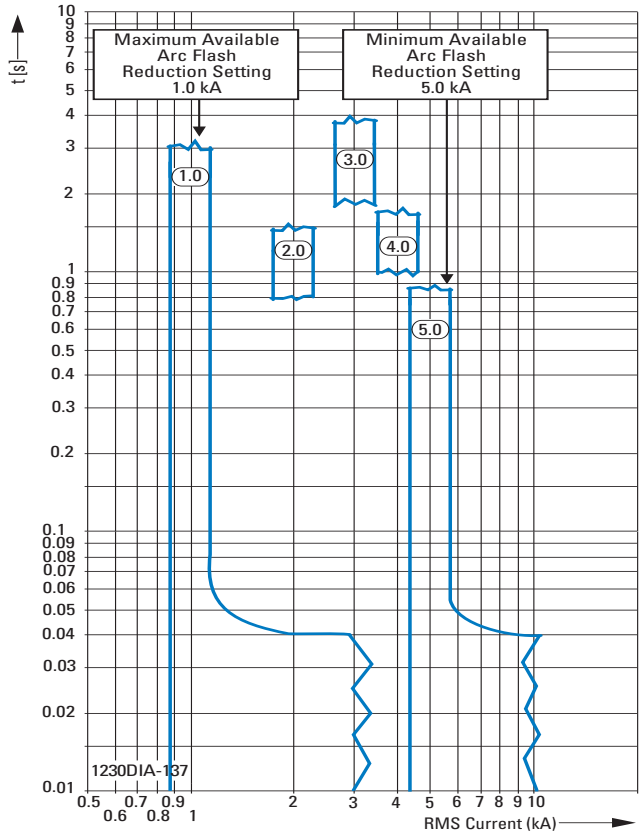
I-protection: For high short-circuit-protection for IZMX40 only
See Notes 5 → Page 62.



Notes The total Instantaneous clearing times shown are conservative and consider the maximum response times of the trip unit, the circuit breaker opening, and the interruption of the current under factors that contribute to worst case conditions, like: maximum rated voltages, single phase interruption, and minimum power factor. Faster clearing times are possible depending on the specific system conditions, the type of circuit breaker applied, and if any arc reduction settings are employed.

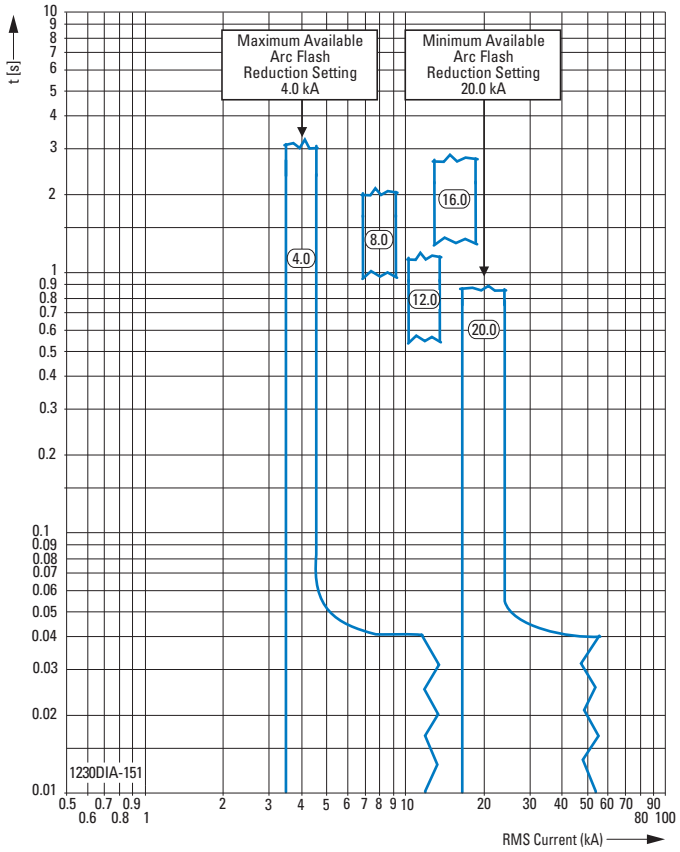
IZMX16…P… Tripping characteristics for professional protection

Digitrip 1150/1150i - Maintenance Mode Curves (ARMS)



IZMX40…P… Tripping characteristic for professional protection

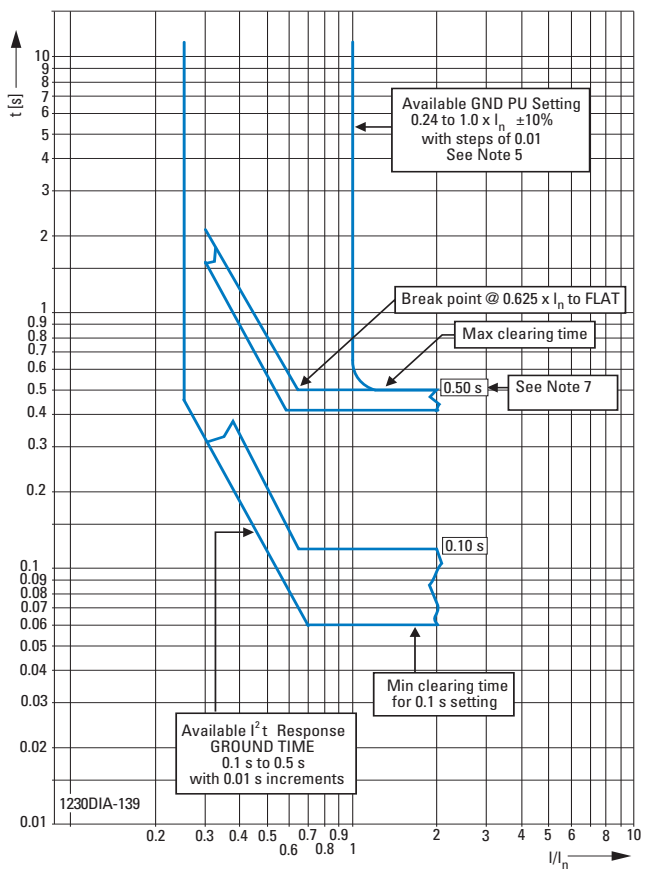
Digitrip 1150/1150i - Maintenance Mode Curves (ARMS)

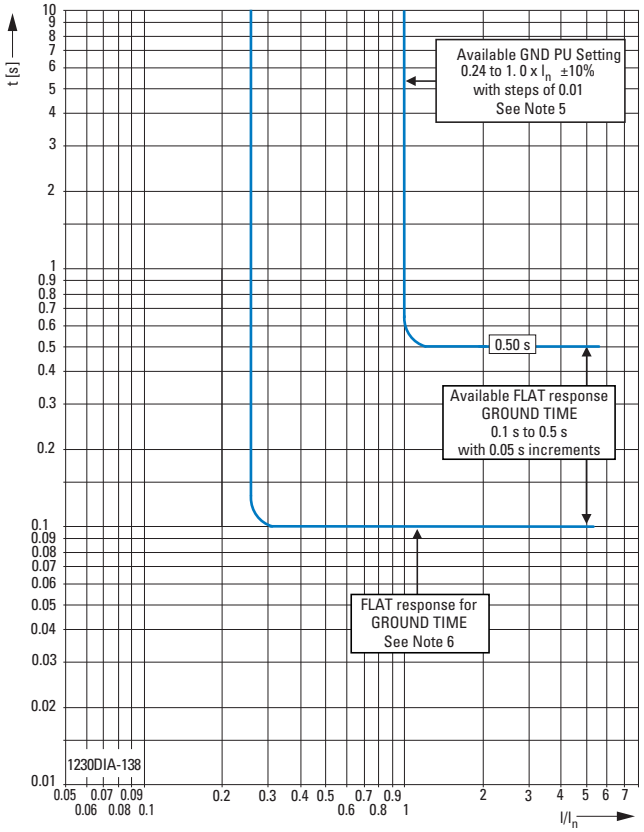


Notes The total Instantaneous clearing times shown are conservative and consider the maximum response times of the trip unit, the circuit breaker opening, and the interruption of the current under factors that contribute to worst case conditions, like: maximum rated voltages, single phase interruption, and minimum power factor. Faster clearing times are possible depending on the specific system conditions, the type of circuit breaker applied, and if any arc reduction settings are employed.

IZMX16(40)…P… Tripping characteristics for professional protection

Digitrip 1150/1150i - G-Ground (Earth) Curves





Apply to Series NRX Type IZMX16 (NF) and IZMX40 (RF) Circuit Breakers. This curve is for 50 Hz or 60 Hz applications.

Notes:

1. The end of the curve is determined by the interrupting rating of the circuit breaker.

2. The curve is shown as a multiple of the Rating Plug (I_n).

3. The Ground Fault settings have conventional 100 % ± 10 % as their pick up points.

4. Except as noted, tolerances on current levels are ± 10 % of values shown in chart.

5. The Ground Fault Pickup is limited to 1200 A setting for the Digitrip 1150 unit. The Digitrip 1150i unit only has a minimum Earth Pickup setting starting at 0.1 x I_n.

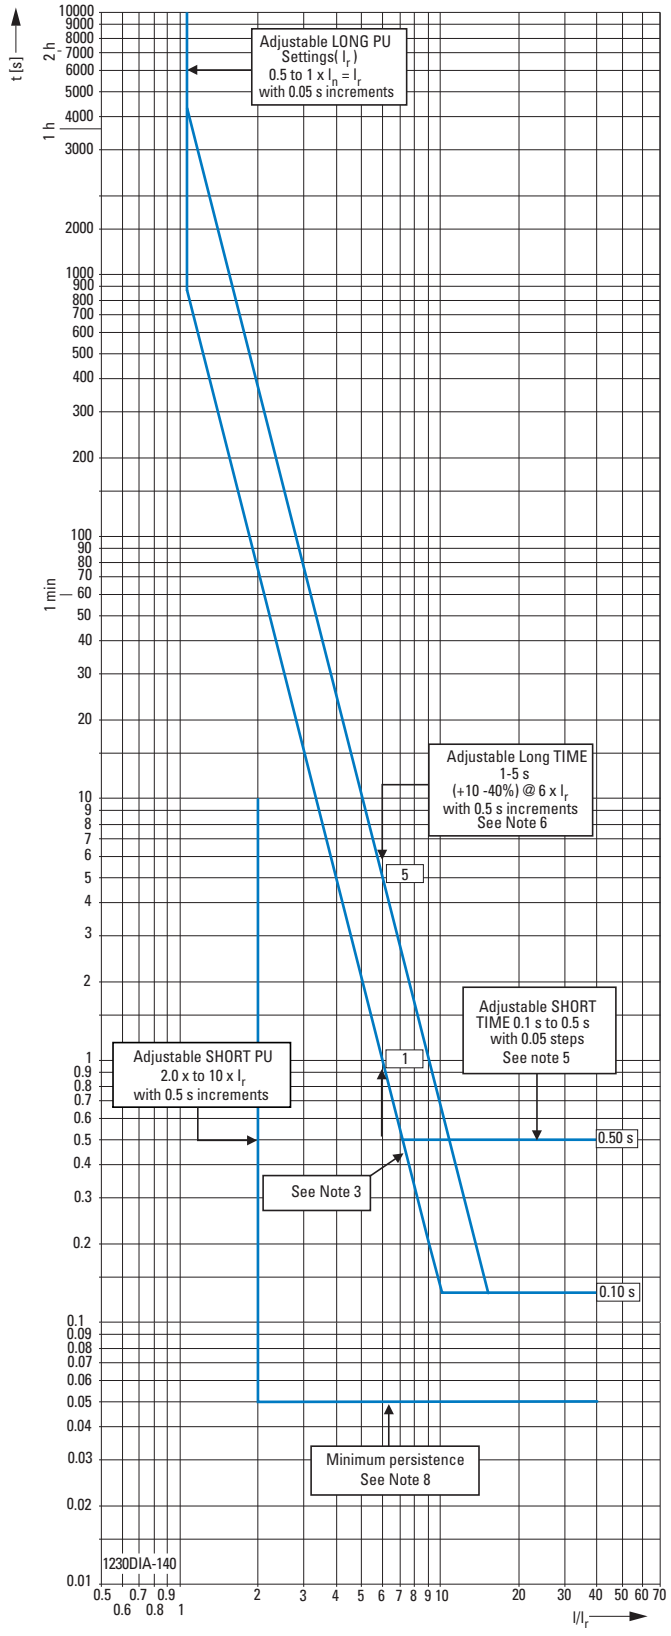
6. Ground Slope: FLAT
Tolerance is +0 / -80 ms except
0.10 s setting band is 0.05 to 0.13
0.15 s setting band is 0.09 to 0.17

7. Ground Slope: I^2T
I^2t slope flattens out at 0.625 x I_n for top of band with FLAT time minimum value n prevailing for bottom of band.
The tolerance is +0 / -30 % for all settings except
0.10 s is +30 % -25%
0.15 s is +20 % -25%
0.20 s is +10 % -25%

Notes The total Instantaneous clearing times shown are conservative and consider the maximum response times of the trip unit, the circuit breaker opening, and the interruption of the current under factors that contribute to worst case conditions, like: maximum rated voltages, single phase interruption, and minimum power factor. Faster clearing times are possible depending on the specific system conditions, the type of circuit breaker applied, and if any arc reduction settings are employed.

IZMX16(40)…P… Tripping characteristics for professional protection

Digitrip 1150/1150i - I^4t Curves



Apply to Series NRX Type IZMX16 (NF) and IZMX40 (RF) Circuit Breakers.
Long Delay (I^4t) & Short Delay Trip
This curve is for 50 Hz or 60 Hz applications.

Notes:

1. This curve is shown as a multiple of LONG PU Setting (I_r). The actual Pickup point occurs at 110 % of I_r, with a ±10 % tolerance.

2. If Long Delay Memory is enabled, trip times may be shorter than indicated on this chart.

3. In this time region ≤ 0.5 seconds the I^4T LONGTIME function will flatten out and be no faster than the Short TIME setting. This is to avoid a notch in graph.

4. The SHORT PU points have conventional 100 % ± 10 % tolerance.

5. SHORT TIME: FLAT only - setting 0.1 s through 0.5 s in .05 s increments. Tolerance is +0 / -80 ms of setting except
0.10 s setting is 0.05 to 0.13
0.15 s setting is 0.09 to 0.17

6. The end of the curve is determined by the interrupting rating of the circuit breaker.

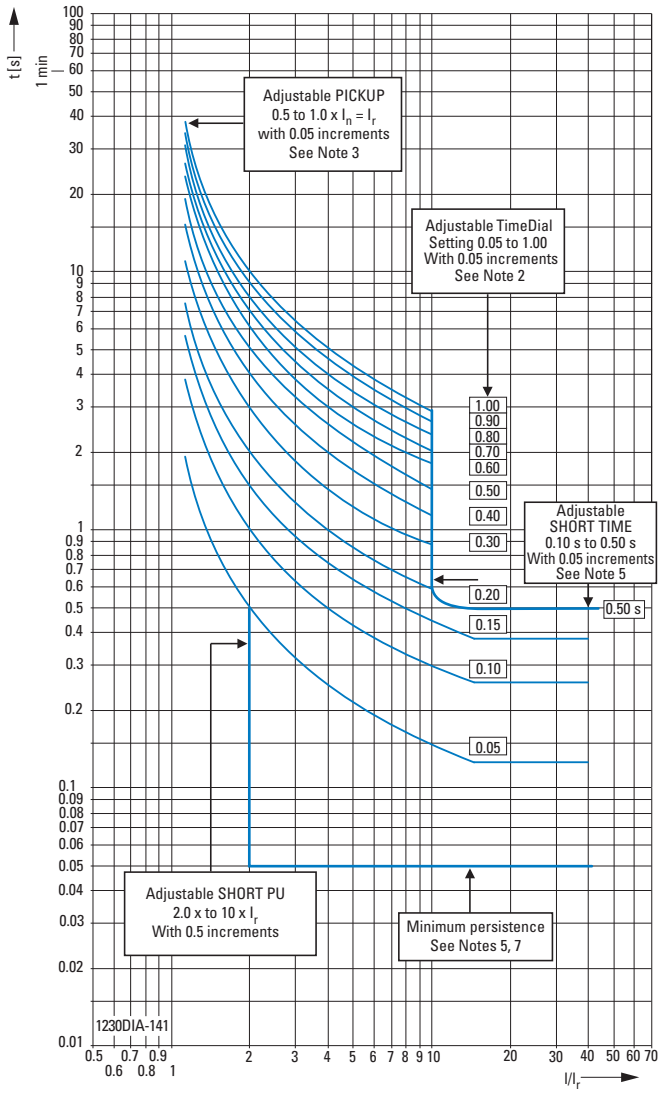
7. Curve applies from -20 °C to +55 °C ambient. Temperatures above +85 °C cause automatic trip.

8. Minimum persistence refers to the time at which the breaker will not trip for a given setting.

Notes The total Instantaneous clearing times shown are conservative and consider the maximum response times of the trip unit, the circuit breaker opening, and the interruption of the current under factors that contribute to worst case conditions, like: maximum rated voltages, single phase interruption, and minimum power factor. Faster clearing times are possible depending on the specific system conditions, the type of circuit breaker applied, and if any arc reduction settings are employed.

IZMX16(40)…P… Tripping characteristics for professional protection

Digitrip 1150i - IEC-A Curves (Normal Inverse)



Apply to Series NRX Type IZMX16 (NF) and IZMX40 (RF) Circuit Breakers.
Normal Inverse & Short Delay Trip
This curve is for 50 Hz or 60 Hz applications.

Notes:

1. This curve is shown as a multiple of the PICKUP setting (I_r). The TimeDial setting combined with SHORT PU and SHORT TIME setting (shown in heavy lines) depict the IEC-A response. The Instantaneous, shown as a separate response, can be set to OFF.

2. For current > 1.2 x I_r tolerance is (±15 %) or (-15 %, +90 ms), whichever is larger. TimeDial curve goes to flat response at 14 x I_r with a shorter time of TimeDial function or SHORT TIME function prevailing if curves overlap. The ShortTime function and the TimeDial function act independently and the entire TimeDial curves continue to be active even after the curves intersect.

3. The actual pick up point occurs at 110 % of I_r current, with a ±10 % tolerance. The actual pick up point is indicated by rapid flashing of Unit Status LED on the product.

The SHORT PU settings have conventional 100 % ± 10 % at their pick up point.

4. The end of the curve is determined by the interrupting rating of the circuit breaker.

5. SHORT TIME: FLAT only
Tolerance is +0 / -80 ms of setting except
0.10 s setting is 0.06 to 0.13
0.15 s setting is 0.10 to 0.17

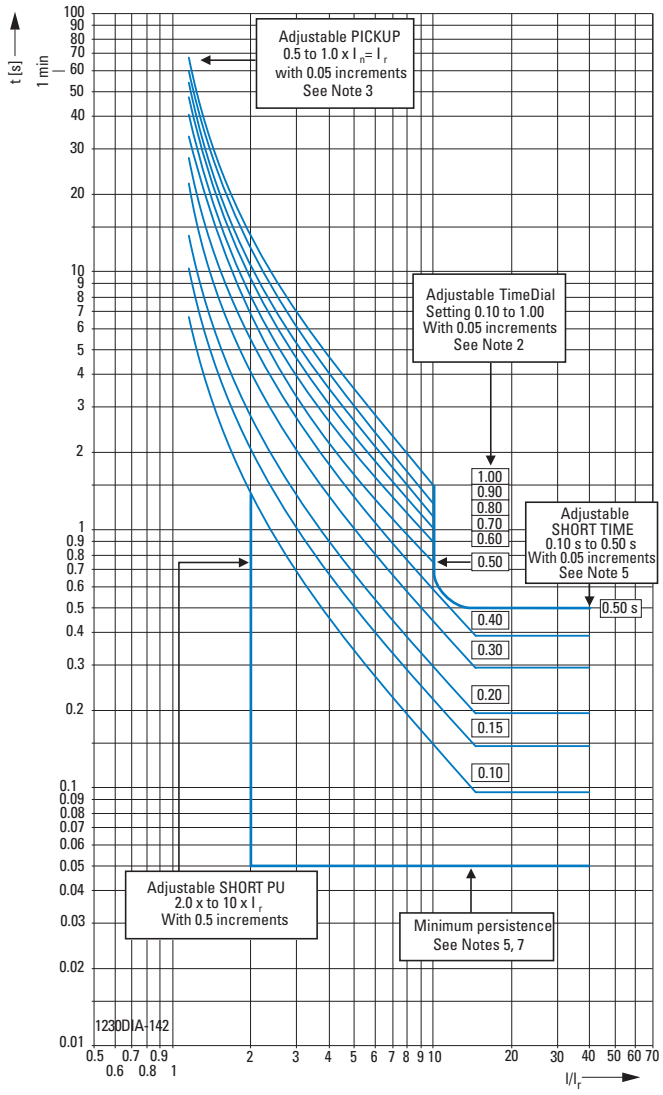
6. Curve applies from -20 °C to +55 °C ambient. Temperatures above 85 °C cause automatic trip.

7. Minimum persistence refers to the time at which the breaker will not trip for a given setting.

Notes These curves are comprehensive for IZMX40 = Series NRX - Type NF frame circuit breakers, including all frame sizes, ratings, and constructions. The total Instantaneous clearing times shown are conservative and consider the maximum response times of the trip unit, the circuit breaker opening, and the interruption of the current under factors that contribute to worst case conditions, like: maximum rated voltages, single phase interruption, and minimum power factor. Faster clearing times are possible depending on the specific system conditions, the type of circuit breaker applied, and if any arc reduction settings are employed.

IZMX16(40)…P… Tripping characteristics for professional protection

Digitrip 1150i - IEC-B Curves (Very Inverse)



Apply to Series NRX Type IZMX16 (NF) and IZMX40 (RF) Circuit Breakers.
Very Inverse & Short Delay Trip
This curve is for 50 Hz or 60 Hz applications.

Notes:

1. This curve is shown as a multiple of the PICKUP setting (I_r). The TimeDial setting combined with SHORT PU and SHORT TIME setting (shown in heavy lines) depict the IEC-B response. The Instantaneous, shown as a separate response, can be set to OFF.

2. For current > 1.2 x I_r tolerance is (±15%) or (-15%, +90 ms), whichever is larger. TimeDial curve goes to flat response at 14 x I_r with a shorter time of TimeDial function or SHORT TIME function prevailing if curves overlap.
The ShortTime function and the TimeDial function act independently and the entire TimeDial curves continue to be active even after the curves intersect.

3. The actual pick up point (indicated by rapid flashing of Unit Status LED on the product) occurs at 110 % of the I_r, current, with a ±10 % tolerance. The SHORT PU settings have conventional 100 % ± 10 % at their pick up point.

4. The end of the curve is determined by the interrupting rating of the circuit breaker.

5. SHORT TIME: FLAT only
Tolerance is +0 / -80 ms of setting except
0.10 s setting is 0.06 to 0.13
0.15 s setting is 0.10 to 0.17

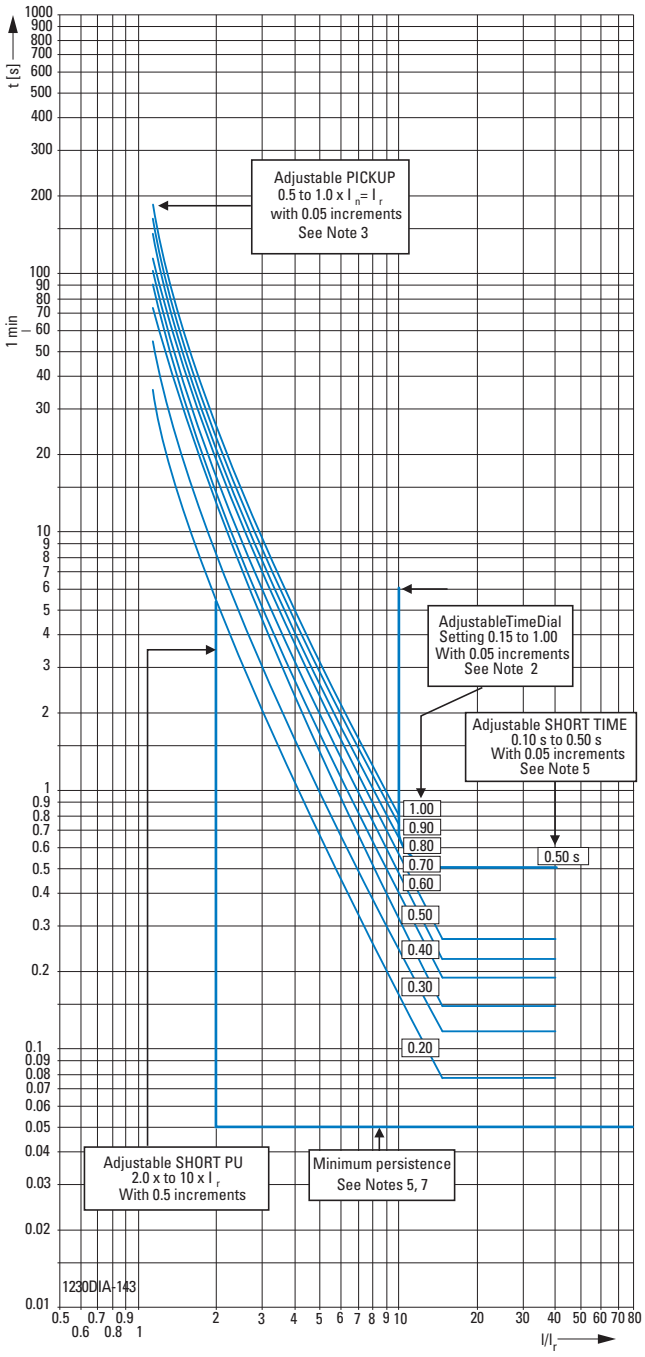
6. Curve applies from -20 °C to +55 °C ambient. Temperatures above +85 °C cause automatic trip.

7. Minimum persistence refers to the time at which the breaker will not trip for a given setting

Notes The total Instantaneous clearing times shown are conservative and consider the maximum response times of the trip unit, the circuit breaker opening, and the interruption of the current under factors that contribute to worst case conditions, like: maximum rated voltages, single phase interruption, and minimum power factor. Faster clearing times are possible depending on the specific system conditions, the type of circuit breaker applied, and if any arc reduction settings are employed.

IZMX16(40)…P… Tripping characteristics for professional protection

Digitrip 1150i - IEC-C Curves (Extremely Inverse)



Apply to Series NRX Type IZMX16 (NF) and IZMX40 (RF) Circuit Breakers.
Extremely Inverse & Short Delay Trip
This curve is for 50 Hz or 60 Hz applications.

Notes:

1. This curve is shown as a multiple of the PICKUP setting (I_r). The TimeDial setting combined with SHORT PU and SHORT TIME setting (shown in heavy lines) depict the IEC-C response. The Instantaneous, shown as a separate response, can be set to OFF.

2. For current > 1.2 x I_r tolerance is (±15 %) or (-15 %, +90 ms), whichever is larger. TimeDial curve goes to flat response at 14 x I_r with a shorter time of TimeDial function or SHORT TIME function prevailing if curves overlap. The ShortTime function and the TimeDial function act independently and the entire TimeDial curves continue to be active even after the curves intersect.

3. The actual pick up point (indicated by rapid flashing of Unit Status LED on the product) occurs at 110 % of I_r current, with a ±10 % tolerance. The SHORT PU settings have conventional 100 % ± 10 % as their pick up point.

4. The end of the curve is determined by the interrupting rating of the breaker.

5. SHORT TIME: FLAT only
Tolerance is +0 / -80 ms of setting except
0.10 s setting is 0.06 to 0.13
0.15 s setting is 0.10 to 0.17

6. Curve applies from -20 °C to +55 °C ambient; temperatures above 85 °C cause automatic trip.

7. Minimum persistence refers to the time at which the breaker will not trip for a given setting.

Notes The total Instantaneous clearing times shown are conservative and consider the maximum response times of the trip unit, the circuit breaker opening, and the interruption of the current under factors that contribute to worst case conditions, like: maximum rated voltages, single phase interruption, and minimum power factor. Faster clearing times are possible depending on the specific system conditions, the type of circuit breaker applied, and if any arc reduction settings are employed.

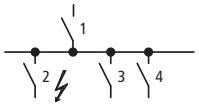
Selectivity: incoming circuit-breaker, outgoing circuit-breaker

IZMX16...



I_n: Rated operational current
I_u: Rated uninterrupted current
I_{cu} : Rated short-circuit breaking capacity
I_i: Set value non-delayed short-circuit releases

Selectivity 415 V AC
Selectivity exists between incoming circuit-breaker 1 and outgoing circuit-breaker 2 if, only outgoing breaker 2 trips at position 2 - during a short-circuit.
System sections 3 and 4 remain operational.

Selection:
Provided that the short-circuit current does not exceed those - values specified ($I_{cc\ rms}$).
These details represent the limits of selectivity.
Both circuit-breakers will switch off with higher short-circuit -currents.
On IZM circuit-breakers with V, U, P releases, the delay time t_{sd} must be at least 100 ms longer than the delay time of the next downstream levels (2, 3, 4).

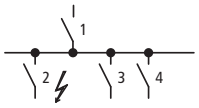
Selectivity: incoming circuit-breaker, outgoing circuit-breaker

IZMX16...



I_n: Rated operational current
I_u: Rated uninterrupted current
I_{cu} : Rated short-circuit breaking capacity
I_i: Set value non-delayed short-circuit releases

Selectivity 415 V AC
Selectivity exists between incoming circuit-breaker 1 and outgoing circuit-breaker 2 if, only outgoing breaker 2 trips at position 2 - during a short-circuit.
System sections 3 and 4 remain operational.

Selection:
Provided that the short-circuit current does not exceed those - values specified ($I_{cc\ rms}$).
These details represent the limits of selectivity.
Both circuit-breakers will switch off with higher short-circuit -currents.
On IZM circuit-breakers with V, U, P releases, the delay time t_{sd} must be at least 100 ms longer than the delay time of the next downstream levels (2, 3, 4).

Notes Series NRX (IZMX) circuit breakers can be applied at their full voltage and current ratings up to a maximum altitude of 2000 meters above sea level. When installed at higher altitudes, the ratings are subject to correction factors. Short circuit current is not affected as long as the voltage is rated in accordance with the table.

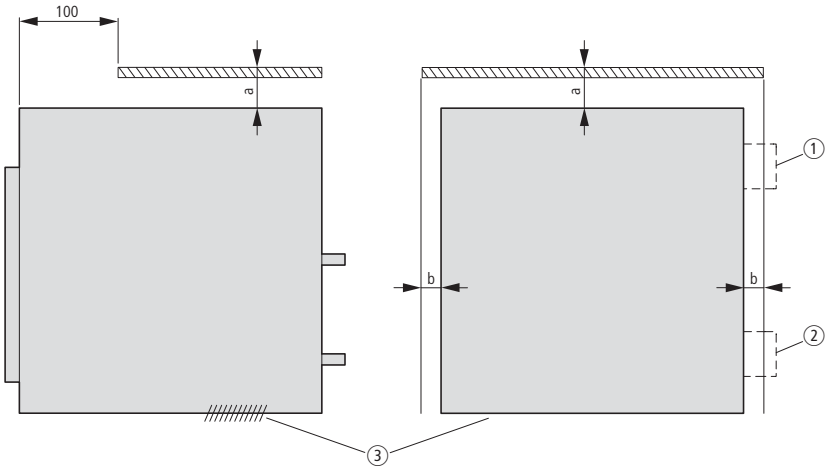
Recommended safety clearances

The following information about safety distances is intended to provide a guideline for the installation of circuit-breakers in an enclosure.

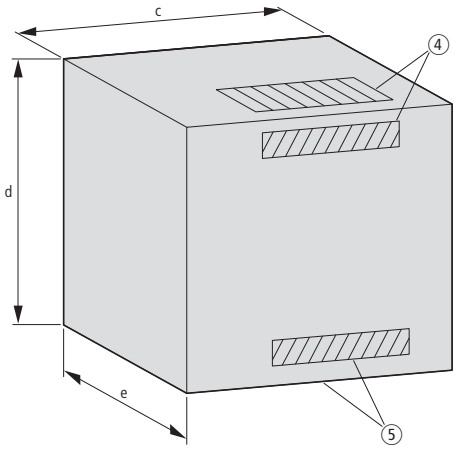


① Cell switch (optional)
② Locking facilities (optional)
③ Ventilation openings (do not cover!)

	Enclosure clearance	To insulated surface	To grounded metal surface	With cell switch or locking facilities
		mm	mm	mm
Withdrawable units	a	0	0	0
	b	25	25	25/75
Fixed mounted	a	150	250	–
	b	30	70	–

Recommended enclosure clearance and ventilation

The illustration shows a typical enclosure.
The table below lists the associated minimum distances between enclosures and ventilation openings.
This information is intended as a guideline for constructing a suitable circuit-breaker enclosure. Ensure the integration complies with IEC 61439.



Width c	Width of cassette + 75 mm	
Height d	550 mm	
Depth e	450 mm (front control panel bay)	
Ventilation holes	160 cm² (800 - 3200 A) 320 cm² (4000 A)	Top and bottom

④ Top or rear vent
⑤ Rear or lower vent

Notes

Powering Business Worldwide

There's a certain energy at Eaton. An energy produced by the combination of globally established engineering companies into one brand. One brand that cleverly and efficiently meets all your requirements in the field of power management and industrial automation. Energy for our customers worldwide – That's what we mean by 'Powering Business Worldwide'. From power distribution and control to industrial automation right through to uninterruptible power supply.

Eaton helps you to manage your entire power system proactively and efficiently. For this we offer you electrical solutions that make your applications safer, more reliable and highly efficient. Visit us at www.eaton.com/electrical.
